to panic: someone from their search party is missing. A quick life-form scan by the ship's computer reveals that when the missing Historian teleported, he arrived in another part of the ship. The door to that area is locked, but the computer can't open it; it can

As you teleport onto Santa's Reindeer-class starship, The Historians begin

only be opened by physically typing the door codes (your puzzle input) on the numeric keypad on the door.

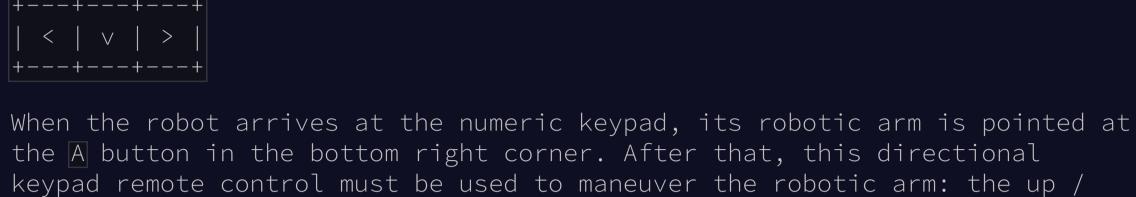

The numeric keypad has four rows of buttons: 789, 456, 123, and finally an empty gap followed by OA. Visually, they are arranged like this:

nobody can go near the door. A robot needs to be sent instead. The robot has no problem navigating the ship and finding the numeric

keypad, but it's not designed for button pushing: it can't be told to push a specific button directly. Instead, it has a robotic arm that can be controlled remotely via a directional keypad. The directional keypad has two rows of buttons: a gap / ^ (up) / A (activate) on the first row and < (left) / 🗸 (down) / > (right) on the

second row. Visually, they are arranged like this: +---+ | ^ | A |

- A to push the 0 button.

direction, and the A button causes the robot to briefly move forward, pressing the button being aimed at by the robotic arm. For example, to make the robot type 029A on the numeric keypad, one sequence of inputs on the directional keypad you could use is: - < to move the arm from A (its initial position) to 0.

down / left / right buttons cause it to move its arm one button in that

- >^^A to move the arm to the 9 button and push it. - vvvA to move the arm to the A button and push it. In total, there are three shortest possible sequences of button presses on

this directional keypad that would cause the robot to type 029A:  $<A^A>^A\lor\lor\lorA$ ,  $<A^AA^>A\lor\lor\lorA$ , and  $<A^A^A>A\lor\lor\lorA$ .

directional keypad instead of a numeric keypad).

type on that directional keypad, too.

- ^A to move the arm to the 2 button and push it.

it. A robot needs to be sent instead. When the robot arrives at the directional keypad, its robot arm is pointed at the A button in the upper right corner. After that, a second, different directional keypad remote control is used to control this robot (in the

same way as the first robot, except that this one is typing on a

Unfortunately, the area containing this directional keypad remote control

is currently experiencing high levels of radiation and nobody can go near

There are multiple shortest possible sequences of directional keypad button presses that would cause this robot to tell the first robot to type 029A on the door. One such sequence is  $V << A >> ^A < A >A V A <^A A >A < V A A A >^A$ . Unfortunately, the area containing this second directional keypad remote

first robot to eventually type 029A on the door. One such sequence is Unfortunately, the area containing this third directional keypad remote control is currently full of Historians, so no robots can find a clear path

there. Instead, you will have to type this sequence yourself.

control is currently -40 degrees! Another robot will need to be sent to

There are many shortest possible sequences of directional keypad button

presses that would cause this robot to tell the second robot to tell the

Were you to choose this sequence of button presses, here are all of the buttons that would be pressed on your directional keypad, the two robots' directional keypads, and the numeric keypad:

In summary, there are the following keypads: - One directional keypad that you are using. - Two directional keypads that robots are using. - One numeric keypad (on a door) that a robot is using.

keypad's A key, wherever it is. To unlock the door, five codes will need to be typed on its numeric keypad. For example: 029A 980A

type to cause the desired code to be typed on the numeric keypad: 029A: <vA<AA>>^AvAA<^A>A<v<A>>^AvA^A<vA>A<A>A 980A: <v<A>> ^AAAVA^A<VA<AA>> ^AVAA<^A>A<V<A>A>A>A>AAAVA<^A>A>A 179A: <v<A>>^A<vA<A>>^AAvAA<^A>A<v<A>>A

The Historians are getting nervous; the ship computer doesn't remember whether the missing Historian is trapped in the area containing a giant electromagnet or molten lava. You'll need to make sure that for each of the five codes, you find the shortest sequence of button presses necessary. The complexity of a single code (like 029A) is equal to the result of

the numeric keypad; for 029A, this would be 68.

- would be 29. In the above example, complexity of the five codes can be found by calculating 68 \* 29, 60 \* 980, 68 \* 179, 64 \* 456, and 64 \* 379. Adding
- these together produces 126384.

Find the fewest number of button presses you'll need to perform in order to

cause the robot in front of the door to type each code. What is the sum of

Your puzzle answer was 212488.

Just as the missing Historian is released, The Historians realize that a

robotic-arm-wielding robots.

multiplying these two values:

second member of their search party has also been missing this entire time! A quick life-form scan reveals the Historian is also trapped in a locked

--- Part Two ---

area of the ship. Due to a variety of hazards, robots are once again dispatched, forming another chain of remote control keypads managing

- One directional keypad that you are using.

This time, many more robots are involved. In summary, there are the

- 25 directional keypads that robots are using. - One numeric keypad (on a door) that a robot is using.

- The keypads form a chain, just like before: your directional keypad controls a robot which is typing on a directional keypad which controls a
- robot which is typing on a directional keypad... and so on, ending with the robot which is typing on the numeric keypad.

directional keypads has changed. Find the fewest number of button presses you'll need to perform in order to

cause the robot in front of the door to type each code. What is the sum of the complexities of the five codes on your list?

If you still want to see it, you can get your puzzle input.

It is important to remember that these robots are not designed for button pushing. In particular, if a robot arm is ever aimed at a gap where no button is present on the keypad, even for an instant, the robot will panic unrecoverably. So, don't do that. All robots will initially aim at the

For each of these, here is a shortest sequence of button presses you could

on your directional keypad in order to cause the code to be typed on - The numeric part of the code (ignoring leading zeroes); for 029A, this
