--- Day 10: Hoof It --
You all arrive at a Lava Production Facility on a floating island in the sky. As the others begin to search the massive industrial complex, you feel a small nose boop your leg and look down to discover a reindeer wearing a hard hat.

The reindeer is holding a book titled "Lava Island Hiking Guide". However,

Our sponsors help make Advent of Code possible:

Lightricks - Are

you nerdy but
also creative? Do
you love AI, but
truly believe the

Perhaps you can help fill in the missing hiking trails?

The topographic map indicates the height at each position using a scale from 0 (lowest) to 9 (highest). For example:

when you open the book, you discover that most of it seems to have been

scorched by lava! As you're about to ask how you can help, the reindeer

brings you a blank topographic map of the surrounding area (your puzzle

from 0 (lowest) to 9 (highest). For example 1234

input) and looks up at you excitedly.

Based on un-scorched scraps of the book, you determine that a good hiking trail is as long as possible and has an even, gradual, uphill slope. For all practical purposes, this means that a hiking trail is any path that starts at height 0, ends at height 9, and always increases by a height of exactly 1 at each step. Hiking trails never include diagonal steps - only up, down, left, or right (from the perspective of the map).

You look up from the map and notice that the reindeer has helpfully begun to construct a small pile of pencils, markers, rulers, compasses, stickers, and other equipment you might need to update the map with hiking trails.

A trailhead is any position that starts one or more hiking trails - here,

these positions will always have height ①. Assembling more fragments of pages, you establish that a trailhead's score is the number of ②-height positions reachable from that trailhead via a hiking trail. In the above example, the single trailhead in the top left corner has a score of ① because it can reach a single ② (the one in the bottom left).

This trailhead has a score of ②:

...0...

...2...
6543456
7....7
8....8
9....9
(The positions marked \(\bar{\text{.}}\) are impassable tiles to simplify these examples;

. . . 1 . . .

8765

9876

This trailhead has a score of 4 because every 9 is reachable via a hiking trail except the one immediately to the left of the trailhead:

they do not appear on your actual topographic map.)

..90..9

...1.98
...2..7
6543456
765.987
876....
987....

This topographic map contains two trailheads; the trailhead at the top has

10..9..
2...8..

a score of  $\boxed{1}$ , while the trailhead at the bottom has a score of  $\boxed{2}$ :

4567654 ...8..3 ...9..2 ....01 Here's a larger example: 89010123

3...7..

78121874 87430965

96549874
45678903
32019012
01329801
10456732

This larger example has 9 trailheads. Considering the trailheads in reading order, they have scores of 5, 6, 5, 3, 1, 3, 5, 3, and 5. Adding these

The reindeer gleefully carries over a protractor and adds it to the pile. What is the sum of the scores of all trailheads on your topographic map?

scores together, the sum of the scores of all trailheads is 36.

--- Part Two ---

The reindeer spends a few minutes reviewing your hiking trail map before realizing something, disappearing for a few minutes, and finally returning with yet another slightly-charred piece of paper.

..7..4.

..8765.

. . 9 . . . .

Your puzzle answer was 535.

The paper describes a second way to measure a trailhead called its rating. A trailhead's rating is the number of distinct hiking trails which begin at that trailhead. For example:

....0.
..4321.
..5..2.
..6543.

The above map has a single trailhead; its rating is 3 because there are

exactly three distinct hiking trails which begin at that position:

 .....0.
 ....0.

 ..4321.
 ....1.

 ..5...
 ....2.

 ..6...
 ..6543.

 ..7...
 ....4.

 ..8...
 .....4.

 ..9...
 ......9.

...1.98

Here is a map containing a single trailhead with rating 13:

...2..7
6543456
765.987
876....
987....

This map contains a single trailhead with rating 227 (because there are 121 distinct hiking trails that lead to the 9 on the right edge and 106 that lead to the 9 on the bottom edge):

345678

4.6789

56789.

45678903

32019012

01329801

10456732

012345 123456 234567

Here's the larger example from before:

89010123
78121874
87430965
96549874

Considering its trailheads in reading order, they have ratings of 20, 24, 10, 4, 1, 4, 5, 8, and 5. The sum of all trailhead ratings in this larger example topographic map is 81.

out of toothpicks and bits of paper and is using them to mark trailheads on your topographic map. What is the sum of the ratings of all trailheads?

You're not sure how, but the reindeer seems to have crafted some tiny flags

you should return to your Advent catendar and try another p
